CAP Report # 178

This report is available on the CURA website:
http://www.cura.umn.edu/publications/search
CAP is a cross-college, cross-campus University of Minnesota initiative coordinated by the Center for Urban and Regional Affairs (CURA). Funds for CAP were generously provided by the McKnight foundation and the Blandin foundation.

This is a publication of the Center for Urban and Regional Affairs (CURA), which connects the resources of the University of Minnesota with the interests and needs of urban communities and the region for the benefit of all. CURA pursues its urban and regional mission by facilitating and supporting connections between state and local governments, neighborhoods, and nonprofit organizations, and relevant resources at the University, including faculty and students from appropriate campuses, colleges, centers or departments. The content of this report is the responsibility of the author and is not necessarily endorsed by CAP, CURA or the University of Minnesota.

I. Executive Summary

The purpose of the 2012 impervious coverage research project was to determine the amount of impervious surfaces on lakeshore parcels for parcels on lakes 500-1000 acres in size. The percent impervious was calculated for the entire riparian lot. The percent impervious was also calculated within 250 feet and 500 feet of the riparian lot. The percent of impervious surfaces was calculated using high resolution Lidar and aerial photography in ESRI’s ArcMap software.

The final product of the impervious coverage study is a comprehensive Geographic Information System (GIS) layer of different surfaces and a calculation of the percent impervious by parcel on the selected lakes. This will help Crow Wing County in its water planning efforts, especially in regards to the effects of stormwater management. It will also help with determining what land use performance standards may be needed for future permit applicants.

II. Purpose

Water is Crow Wing County’s lifeblood. The county has an area of 731,000 acres and approximately 102,000 acres or 14% is covered by over 400 scenic lakes, rivers, and streams. An additional 14% is covered by wetlands as well. The abundance of surface water makes this Central Minnesota County an attraction to people.

From 1990 to 2000 the population in Crow Wing County has increased by 24.5%, the eleventh fastest growth county of Minnesota’s 87. The most recent census shows the population continued to grow another 13.4% from 2000 to 2010. The majority of the growth is concentrated around the clear, deep water lakes where seasonal cabins are being replaced with larger year-round homes. With these larger homes comes the potential for more stormwater runoff into these majestic lakes.

Crow Wing County revised its Land Use Ordinance in 2011. This ordinance placed added performance standards based on the amount of impervious surfaces per lot. It is now required to
have a storm water management plan if the riparian lot exceeds 15% in impervious surfaces. The ordinance prohibits more than 25% impervious surfaces in the shoreland protection zone (Article 41). This ordinance will help keep lakes clean for generations to come.

This study defines the percent of impervious surfaces on individual lots. It is needed to maintain the integrity and build the foundation for future studies. We as individuals need to realize that our planning today will make a huge impact on the future. It does not take long to damage our natural resources, such as these waterways and lakes, but it will take generations to get them back to the way they are today.

III. Process

This Phase II study is a continuation of a project I previously worked on with staff from the Crow Wing County Land Services Department. The information needed was the amount of impervious surfaces within 500 feet of the Ordinary High Water. They wanted to know the different kinds of impervious surfaces such as bituminous driveways, gravel driveways, dirt driveways, grass driveways, boathouses, dwellings, sheds, garages, patios, and so on. This information will help determine future updates to the local water plan.

Using ArcMap, I created different layers for all the different kinds of impervious surfaces and began digitizing them. Layers are used to display and work with a specific GIS dataset. A layer in ArcMap represents geographical data such as a particular theme and in this case it is the impervious surfaces. In certain instances, it was impossible to see the entire building on the
aerial photo. In these instances I had to use county records to find out the dimensions of the structure. The Property Valuation and Classification Office has records on all the structures in the county. Using this information I could determine the percent of impervious per lot.

A calculation change specific to Planned Unit Developments (PUD’s) will also be implemented. Previously, we calculated the impervious surface areas for each unit or lot within a PUD. The new calculation will total the impervious surface areas within the entire PUD, rather than as individual parts (an example is included in the appendices).

** Some parcels not included because they are located inside city limits.

^A “Planned unit development” means a type of development characterized by a unified site design for a number of dwelling units or dwelling sites on a parcel, whether for sale, rent, or lease, and also usually involving clustering of these units or sites to provide areas of common open space, density increases, and a mix of structure types and land uses. These developments may be organized and operated as condominiums, time-share condominiums, cooperatives, full fee ownership, commercial enterprises, or any combination of these, or cluster subdivisions of dwelling units, residential condominiums, townhouses, apartment buildings, campgrounds, recreational vehicle parks, resorts, hotels, motels, and conversions of structures and land uses to these uses.

CAP is a cross-college, cross-campus University of Minnesota initiative coordinated by the Center for Urban and Regional Affairs (CURA). Funds for CAP were generously provided by the McKnight foundation and the Blandin foundation.

This is a publication of the Center for Urban and Regional Affairs (CURA), which connects the resources of the University of Minnesota with the interests and needs of urban communities and the region for the benefit of all. CURA pursues its urban and regional mission by facilitating and supporting connections between state and local governments, neighborhoods, and nonprofit organizations, and relevant resources at the University, including faculty and students from appropriate campuses, colleges, centers or departments. The content of this report is the responsibility of the author and is not necessarily endorsed by CAP, CURA or the University of Minnesota.
