This map shows gains and losses of people during the decade of the 2000s. A black dot represents 50 persons gained; a red dot represents 50 persons lost. Census tracts were used as the unit of calculation, but dots were placed based on block data. Manual adjustments to location were made to move dots from parks and other public land to roads and lakeshore. In more sparsely settled areas of the state, dots may summarize a population scattered across a wide geographic area.
