MINNESOTA POPULATION CHANGE, 1970 – 1980

Based on Minor Civil Division (MCD) data from the 1970 and 1980 Census of Population. Dots are placed randomly within the boundary of each city, township, or unorganized territory. Where two or more areas involved in a significant boundary change, e.g. annexation, these areas were combined and treated as a single unit when determining the number of dots to allocate to a given location. However, these dots were then distributed in proportion to the 1970 populations of the component MCDs.
